

INDIVIDUAL CONTRIBUTION RECORD

Student Name: Michael George

Student Number: 225076462

Assigned Responsibility: Student 1 - Employee Management Module

1. Overview

I was responsible for the Employee Management module of the Municipal Financial Management System (MFMS). It handles adding workers to the system, looking them up and calculating their pay.

2. Files Created

- employees.c - contains the code for the module.
- employees.h - declares the functions used by other files.

3. Tasks Completed

- Add employee (ID, name, department, basic salary, housing and transport allowances).
- Display all employees.
- Search for an employee by ID or name (using strcmp()).
- Calculate salary (basic salary + allowances).
- Input validation (no negative salary, no empty name).

4. Integration with Other Modules

- The Employee Management option in main.c calls the module's menu function.
- Employee data can be used by the Reports module, for example to calculate the average salary.

5. Testing

- Added several employees and checked that they were displayed correctly.
- Searched by ID and by name to confirm the correct employee is found.
- Checked that the salary calculation is correct.
- Entered a negative salary and an empty name to confirm they are rejected.

6. Conclusion

My contribution gives the MFMS a reliable way to manage employee records and calculate pay.
